1. Slide 01
   Project Name : Evilog : Evidence Management System
   College Name : D.Y.Patil College Of Engineering, Akurdi, Pune
   Department Name : Robotics and Automation (RA)
   Project Title : Evilog
   Group Members :
   1. Bhavik
   2. Om
   3. Sai
   4. Tanuja
   5. Vedant

2. Slide 02 : Abstract
   1. EviLog is a smart system for tracking physical evidence.
   2. It helps monitor the storage, movement, and handling of evidence.
   3. Each evidence package is given a unique RFID tag.
   4. Every movement is recorded with details like evidence ID, handler, location, time, and status.
   5. The system reduces dependence on manual records and paperwork.
   6. It can also provide tamper detection and unauthorized-movement alerts.
   7. The system maintains a traceable history of evidence movement.
   8. EviLog is designed as a low-cost prototype using components such as ESP32, RFID, RTC, display, and buzzer.

3. Slide 03 : Intro
   a. Physical evidence must be properly stored, handled, and tracked during an investigation.
   b. Evidence can move between police stations, storage areas, forensic labs, and courts.
   c. Manual records and paperwork can make tracking time-consuming.
   d. Multiple handlers can make it difficult to maintain a continuous record of movement.
   e. EviLog aims to create a digital record of evidence movement.
   f. The system helps track who handled the evidence, where it was moved, and when it happened.
   g. It is designed to support existing evidence-handling procedures, not replace them.

4. Slide 04 : Literature Review
    a. RFID has been widely studied for item identification and traceability.
    b. RFID-based systems can support low-cost asset tracking.
    c. Data provenance research focuses on maintaining the history and source of information.
    d. Forensic research emphasizes maintaining a proper chain of custody.
    e. Recent research highlights the need to record custodians and actions throughout the evidence lifecycle.
    f. Research Gap: These concepts can be combined into a low-cost system focused specifically on physical evidence movement and monitoring.

5. Slide 05 : PS
    a. Physical evidence must be properly stored, handled, and tracked throughout an investigation.
    b. Evidence may move between different authorized personnel and locations.
    c. Maintaining records for every movement through manual paperwork is time-consuming.
    d. Manual records may lead to missing or incorrectly recorded information.
    e. It can be difficult to quickly identify the current location and status of evidence.
    f. A system is needed to maintain a systematic digital record of evidence movement.
    g. The system should also support tamper detection and unauthorized-movement alerts.

6. Slide 06 : Objectives
    a. Develop a system to uniquely identify evidence using RFID tags.
    b. Record evidence movement with details such as handler, location, time, and status.
    c. Maintain a digital history of evidence transactions for easy tracking.
    d. Implement basic tamper and unauthorized-movement alerts for improved monitoring.

7. Slide 07 : Scope
    a. Register each evidence item with a unique RFID tag.
    b. Identify and verify the evidence and authorized handler during each transaction.
    c. Record the evidence movement, including handler, location, time, and status.
    d. Monitor the evidence container for tampering or unexpected movement.
    e. Display important information and alerts using the system interface.
    f. Store the transaction history for later tracking and verification.

8. Slide 08 : Current Techniques Used
    a. Manual registers and paperwork are commonly used to record evidence handling.
    b. Barcode-based identification is used to identify and track physical items.
    c. RFID technology is used for automatic identification and tracking of tagged items.
    d. Digital databases can store information about item movement and handling.
    e. Chain-of-custody records are maintained to document the transfer of evidence between authorized personnel.

9. Slide 09 : Flowcharts

10. Slide 10 : Components List

11. Slide 11 : Conclusion
    a. EviLog provides a simple way to identify and track physical evidence using RFID technology.
    b. It reduces dependence on manual record-keeping and paperwork.
    c. The system maintains a digital record of who handled the evidence, when, and where.
    d. Tamper detection and alerts help improve evidence monitoring.
    e. The project demonstrates how Robotics and Automation can be applied to a real-world evidence management problem.
    f. EviLog aims to support a more systematic and traceable evidence-handling process
